

Bug Report: BUG_01

Summary: Invalid special characters accepted in 'Jahr' field.

Severity: Major (Impacts database integrity).

Priority: Medium.

Description: The application fails to properly validate the 'Jahr' field in the date of birth section on Step 5. Inputting special characters (e.g., "2026,") is incorrectly accepted as valid, triggering a green success indicator and enabling the "Reservieren" button.

Steps to Reproduce:

1. Navigate to Step 5 of the booking process.
2. Fill all mandatory fields.
3. Enter a year followed by a special character in the 'Jahr' field (e.g., 2026 ,).
4. Click outside the field to trigger validation.

Expected Result: The system should reject non-numeric input and display the error: "Bitte geben Sie ein zulässiges Geburtsdatum ein." The "Reservieren" button must remain disabled until valid numeric data is entered.

Actual Result: The system interprets the input as valid, displays a green success marker, and enables the "Reservieren" button.

Environment: All browsers (Chrome, Firefox, Safari); OS: macOS / Windows.

Note on Reproduction: This defect is consistently reproducible via manual input. Automated validation attempts are currently blocked by site-specific security/masking layers, confirming that the site's frontend input logic bypasses standard event triggers for special characters.

Mandatory Artifacts: [Screenshot_BUG_01.png attached].

Bug Report: BUG_02

- **Summary:** Inconsistent email validation allows invalid format on Step 5.
- **Severity:** Critical (Blocks business process).
- **Priority:** High.
- **Description:** On Step 5, the email input field fails to validate the format correctly. It incorrectly marks invalid input (e.g., >@+ / . ()) as valid (green status indicator) and enables the "Reservieren" button. This prevents users from receiving appointment confirmations, rendering the booking process unreliable.

Steps to Reproduce:

1. Navigate to Step 5 of the booking process.
2. Fill all mandatory fields.
3. Enter invalid data in the Email field (e.g., >@+ / . ()).
4. Click outside the field to trigger validation.

Expected Result: Email field must display a red indicator and show the error text: "Bitte geben Sie eine zulässige Mailadresse ein." "Reservieren" button must remain disabled until valid email data is entered.

Actual Result: The system interprets the input as valid. A green success marker appears. "Reservieren" button becomes enabled.

Environment:

- All browsers (Chrome, Firefox, Safari)
- OS: macOS / Windows

Mandatory Artifacts: [Screenshot_BUG_02.png attached].

Bug Report: BUG_03

Summary: Calendar UI renders blank page on API 500 error when transitioning to Step 4.

Severity: Blocker (Total failure of the critical booking path).

Priority: High.

Description: When the Calendar API (`calendar.js`) returns an HTTP 500 error, the booking UI fails to handle it gracefully. Instead of a user-friendly error notification, Step 4 renders a blank page. This forces the user to reload, causing a complete loss of booking flow progress.

Steps to Reproduce:

1. Navigate to the booking process.
2. Proceed through Steps 1, 2, and 3 (Location selection) to navigate to Step 4 (Calendar selection).
3. Simulate an HTTP 500 Internal Server Error for `calendar.js`.
4. Observe the interface behavior on the screen.

Expected Result:

The system must catch the API exception. The UI should display a user-friendly error message. The navigation should remain in a controlled state.

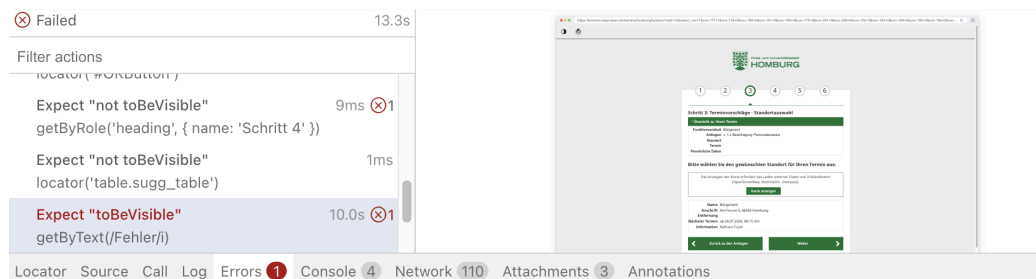

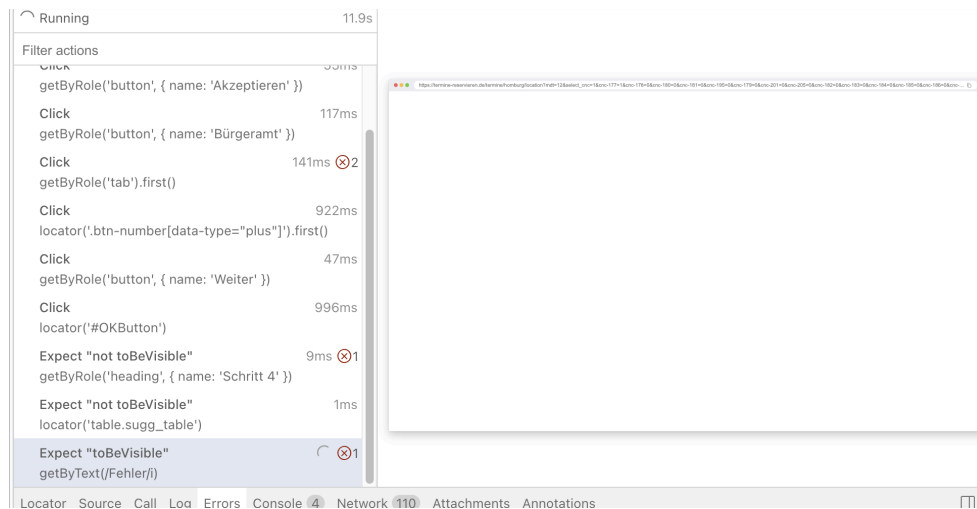

Actual Result:

The calendar component fails to render, resulting in a blank UI container. No error message is shown, leaving the user without feedback.

Environment:

- All browsers (Chrome, Firefox, Safari)
- Scenario: API Error Handling (Simulated 500)

Mandatory Artifacts: [Screenshot_BUG_03.png attached].

@ system_errors.spec.js:91

Error: expect(locator).toBeVisible() failed

Locator: getByText(/Fehler/i)
Expected: visible
Timeout: 10000ms
Error: element(s) not found

Call log:
- Expect "toBeVisible" with timeout 10000ms
- waiting for getByText(/Fehler/i)

Bug Report: BUG_04

Summary: Frontend validation accepts invalid 4-digit postal code (PLZ) on Step 5.

Severity: Medium (Data quality & validation bypass).

Priority: Medium.

Description: On Step 5, the PLZ ('Postleitzahl') input field incorrectly validates 4-digit postal codes (e.g., "1234") as valid. German postal codes strictly consist of 5 digits. Accepting a 4-digit input bypasses input sanitization and risks saving incomplete address data.

Steps to Reproduce:

1. Navigate to Step 5 of the booking process.
2. Enter mandatory fields.

3. Enter a 4-digit string in the PLZ field (e.g., "1234").
4. Trigger validation by moving focus away from the field (Tab or click outside).

Expected Result:

The field should reject 4-digit inputs and display the error message: "Bitte geben Sie eine zulässige Postleitzahl ein." The "Reservieren" button must remain disabled.

Actual Result:

The field accepts the 4-digit input as valid (green indicator appears) and enables the submission process.

Environment:

- All browsers (Chrome, Firefox, Safari)
